

Title: Criteria for Approval
Standard Operating Procedure: #11
Department: Human Research Protection Program/Institutional Review Board
Original Publication Date: March 22, 2010
Revision Date: September 2015

Subject: Criteria for Approval of a Human Subjects Research Study

Policy:

In order to approve human subjects research, the LLNL IRB must determine that all of the requirements for approval are satisfied, as outlined in 45 CFR 46.111(a)(1-7)(b).

Procedures:

I. Criteria for Approval

The IRB will approve a research protocol only if the following criteria for approval are satisfied:

- Risks to subjects are minimized.
- Risks to subjects are reasonable in relation to anticipated benefits.
- Selection of subjects is equitable.
- Informed consent is adequate and appropriately documented.
- Where appropriate, the research plan makes adequate provision for monitoring the data collected to ensure the safety of subjects.
- Where appropriate, there are adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data.
- Appropriate safeguards have been included to protect vulnerable subjects (i.e., children, prisoners, and pregnant women) in accordance with 45 CFR 46 Subparts B, C, and D.

A. Risks to Subjects Are Minimized

1. Risks to subjects are minimized by using procedures which are consistent with suitable research design and which do not unnecessarily expose subjects to risk, and whenever appropriate, by using procedures already performed on the subjects for diagnostic or treatment purposes.
2. Risks to subjects are reasonable in relation to anticipated benefits, if any, to subjects, and the importance of the knowledge that may reasonably be expected to result.
3. Selection of subjects is equitable. In making this assessment the IRB should take into account the purposes of the research and the setting in which the research will be conducted and should be particularly cognizant of the special problems of research involving vulnerable populations, such

as children, prisoners, pregnant women, mentally disabled persons, or economically or educationally disadvantaged persons. Defining the appropriate group of subjects for a research project involves a variety of factors—requirements of scientific design, susceptibility to risk, likelihood of benefit, practicability, and considerations of fairness. IRBs are required to make a specific determination that the selection of subjects is equitable.

4. Informed consent will be sought from each prospective subject or the subject's legally authorized representative in accordance with, and to the extent required by, 45 CFR 46.116.
5. Informed consent will be appropriately documented in accordance with, and to the extent required by, federal and institutional policies.
6. When appropriate, the research plan makes adequate provision for monitoring the data collected to ensure the safety of subjects.
7. When appropriate, there are adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data.

B. Vulnerable Populations

When some or all of the subjects are likely to be vulnerable to coercion or undue influence, such as children, prisoners, pregnant women, mentally disabled persons, or economically or educationally disadvantaged persons, additional safeguards have been included in the study to protect the rights and welfare of these subjects.

C. Assessing Suitable Study Design

A human research study should be well designed according to proper scientific principles and be preceded by adequate laboratory and/or animal studies. A study which will not yield valuable data is unacceptable.

The LLNL IRB shall consider the following points when assessing suitable study design:

1. Has the rationale and basis for the study hypothesis been provided in the background information?
2. Is the scientific design adequate to answer the research questions posed?
3. Is the sample size (number of subjects) adequate?
4. Is the method proposed for selecting and assigning subjects to treatment groups unbiased?
5. Are the study endpoints and methods of data analysis appropriate for the study?

D. Assessing Risks and Anticipated Benefits, If Any, to Subjects

The LLNL IRB shall conduct a risk/benefit analysis. The LLNL IRB will ensure that risks to all subjects are minimized and are reasonable when compared to the benefits of participating in the research study or the knowledge that will be gained from participation in the study. The IRB shall carefully assess each risk and benefit to the study to determine if the benefits outweigh the risks and, therefore, justify the use of human subjects.

E. Assessing Equitable Selection of Subjects

While studies of a captive group of subjects, such as students, laboratory personnel, and hospitalized patients may be useful and desirable and can be conducted in an ethical fashion, a scrupulous effort must be made to preserve the individual's rights because of the possibility of coercion.

Studies of volunteers in the investigator's own department or who are the investigator's students should be avoided and will usually be disapproved by the LLNL IRB because of the subtle coercive factors that could be present in even the most harmonious situations.

The LLNL IRB shall consider the following points when assessing equitable selection of subjects:

1. Does the nature of the research require or justify using the proposed study population?
2. Will the solicitation of subjects avoid placing a disproportionate share of the risks and discomfort as well as inconvenience of the research on any single group of individuals?
3. Are women of childbearing potential eligible for participation or, if not eligible, has their exclusion been justified?
4. Has the selection process overprotected potential subjects who are considered vulnerable so that they are denied opportunities to participate in research?
5. Are any payments to subjects reasonable, based upon the complexities and inconveniences of the study and the particular subject population?

In making this assessment, the IRB takes into account the purposes of the research and the setting in which the research will be conducted and is particularly cognizant of the special problems of research involving vulnerable populations, such as children, prisoners, pregnant women, mentally disabled persons, or economically or educationally disadvantaged persons [45CFR 46.111(3)].

F. Assessing Methods for Obtaining Informed Consent of Subjects or Legal Representatives

Communication between subject and investigator should embody aspects similar to those in a good patient–doctor relationship. The discussion with the potential participant by the principal investigator or co-investigator should include the purpose of the research, the procedures to be followed, and the discomforts, risks and possible benefits, if any. The signing of the consent document should signify that a thorough discussion has taken place and will continue to take place during the conduct of the study.

G. Assessing Privacy and Confidentiality Protections

During the course of a study, the highest standards should be maintained with regard to the privacy and confidentiality of information, including interviews, photographs, and other records concerning the subject. Although more investigators and staff may be involved in the conduct of a study than might occur in the usual course of treatment of a patient, confidentiality standards should not be relaxed.

The Belmont Report describes how the principles of respect for persons, beneficence, and justice are relevant to research involving human subjects. The principle of respect for persons demands that subjects' decisions whether to become involved in research must be voluntary and informed. Investigators have a responsibility to recruit subjects in such a manner that they not feel pressured to agree, and that they have ample time to discuss the study procedures and to ask questions.

Justice in particular relates to the selection of research subjects. The selection process needs to be scrutinized in order to determine whether some classes (e.g., welfare patients, racial and ethnic minorities, or persons confined to institutions) are being systematically selected simply because of their easy availability, their compromised position, or their manipulability, rather than for reasons directly related to the issues being studied. Whenever research leads to the development of therapeutic devices and procedures, justice demands both that these not provide advantages only to those who can afford them and that such research should not unduly involve persons from groups unlikely to be among the beneficiaries of subsequent applications of the research.

The selection of subjects must be fair and equitable. In assessing whether selection of subjects is equitable, the IRB takes into account the purposes of the research and the research setting.

Potentially beneficial research should not be offered only to some patients who are pleasant to work with; likewise, higher risk or research with no potential benefit to the subjects should not be targeted only at “undesirable” populations. Social justice requires that distinction be drawn between classes of subjects that ought, and ought not, to participate in any particular kind of research, based on the ability of members of that class to bear burdens and on the appropriateness of placing further burdens on already burdened persons. Thus, it can be considered a matter of social justice that there is an order of preference in the selection of classes of subjects (e.g., adults before children) and that some classes of potential subjects (e.g., the institutionalized, mentally infirm, or prisoners) may be involved as research subjects, if at all, only under exceptional conditions.
